TillageMax Homestead® is a true soil builder, helping restore soil health following challenging conditions like extended drought or flood. Tillage Sunn® is a tropical warm weather legume that thrives in dry conditions and poor soil, and suppresses nematodes. It can produce over 60 lbs of N in 6 weeks. CCS Sorghum Sudangrass adds plenty of biomass both above ground and with its roots.

EXCELLENT FOR:
- Weed Suppression
- Reducing erosion from runoff and wind
- Adding biomass
- Drought resistance
- Summer nitrogen production
- Prevent plant acres

PLANTING TIPS AND SEEDING RATES:

PLANTING: Plant in late spring after last frost to 8 weeks before first fall frost. Best to plant when soil temperature is 60 degrees or more.

PLANTING DEPTH: 1”

SEEDING RATE:

DRILLING: 15 lbs/acre

PRECISION PLANTING (15” WITH 4” IN-ROW): 12 lbs/acre

CONTROL: Tillage Sunn® and CCS Sorghum Sudangrass should kill with the first frost. Tillage Radish® is winter killed with a few nights in the mid-teens. One quart of glyphosate and one pint of a 2,4-D product will control any Tillage Radish® that may not have been terminated.

BEST TO PLANT: After wheat harvest or any other period that allows for adequate GDD accumulation; can be planted in front of both corn/milo and soybeans.

FORAGE:

Increase seeding rate to 30 lbs/acre.
